Profile

Full-stack developer who builds products end to end and keeps them running. I founded Jornal (jornal.work), a workforce-management SaaS serving real customers, and co-founded MMENTO, an iOS/Android app published on both stores. I own the whole stack: React and Next.js on the front, PostgreSQL and complex SQL underneath, plus the infrastructure, CI and compliance around it. What I care about is the part nobody sees — multi-tenant isolation verified by scripts that try to break it, migrations checked against a real database engine before they ship, and backups proven by restoring them.

Core Competencies

- **TypeScript & React:** Production React, Next.js (App Router) and React Native (Expo) — component architecture, hooks, state management, rendering performance; shared typed domain cores consumed by multiple applications
- **PostgreSQL & advanced SQL:** Schema design, row-level security, SECURITY DEFINER functions, triggers, append-only auditing; 34 Postgres functions (~6,400 lines of SQL) powering a live product-analytics panel
- **Testing & quality:** Vitest, Jest and React Testing Library across 163 suites with coverage thresholds; database integration tests that run a real PostgreSQL engine against actual migrations instead of mocks
- **CI/CD & operations:** GitHub Actions gating every push with typecheck, zero-warning lint, tests and build; EAS mobile builds, Sentry monitoring, transactional email with DKIM/DMARC, verified backups
- **Backend & product ownership:** Node services and Deno edge functions, REST design, third-party webhooks, authentication, background queues; requirements gathered directly from users, GDPR compliance, App Store and Google Play releases
- **AI-assisted development:** Claude Code and Codex daily; GPT-4 API integrated into a shipped consumer product

Professional Experience

Jornal (jornal.work)

Founder & CTO

Remote, Spain

2024-Present

- Built a workforce-management SaaS end to end, live with paying customers: a React/TypeScript web app plus an iOS/Android app sharing one typed domain core over PostgreSQL with row-level security
- Wrote complex business engines in SQL: leave accrual based on each person's real schedule, carry-over between years, shift planning with overlap detection and coverage warnings
- Built 40+ database integration scripts booting a real PostgreSQL engine in-process (PGLite/WASM) against the actual migrations to assert RLS, triggers, immutability and concurrency in ~45 seconds, with no Docker
- Owned operations and compliance end to end: 112 additive migrations behind feature flags, backups proven by restoring them, transactional email (DKIM/DMARC), full CI on every push, plus Spanish time-tracking regulation and GDPR

MMENTO

Co-Founder & Full-Stack Developer

Remote, Spain

2025-Present

- iOS/Android app in React Native and TypeScript with an offline-first architecture and idempotent sync queue, vector search over 20,000+ products with pgvector, resumable video uploads to Cloudflare Stream and in-app purchases. Published on the App Store and Google Play
- Built mmento Analytics, the internal product-analytics panel used for real decisions: DAU/WAU/MAU, cohort retention, search funnel and monetisation across 34 Postgres functions (~6,400 lines of SQL), with cohorts computed live to exclude test accounts, Redis rate limiting and per-mutation auditing
- Maintained 122 Jest suites with a 50% coverage threshold; designed a static contract test pattern (78 suites) catching drift between two runtimes with no shared types
- Wrote three Expo config plugins from scratch to unblock native build issues; production monitored with Sentry

Fuenlegal SL

Full-Stack Developer & Administrator

Málaga, Spain

Nov 2022-Present

Built and maintain an internal React web application for time tracking, leave and task management with TypeScript, Tailwind CSS and PostgreSQL, in daily use by staff — gathering requirements directly from the people who use it and iterating on their feedback

Japify

Mobile Developer

Remote

Sep 2024-Dec 2024

Shipped a mobile app from scratch with React Native, Expo, Supabase and TypeScript in 3 months, working solo — authentication, real-time chat, matching algorithms and file uploads, with the full design in Figma

Not a Serious Game Studio / Univ. de Santiago

Game Developer & Team Lead

Madrid & Remote

2019-2021

Led a team of 5 through the full development and Steam release of Agent-00 (70 reviews, ~1000 downloads) in Unreal Engine 4, and a team of 3 on an educational title adopted for university classes

Personal Projects

- **Quant Lab** — Algorithmic trading lab: exchange connectivity via CCXT, a backtesting engine, fractional-Kelly position sizing and risk management, with on-chain execution on Polygon/Solana. Anti-replay guaranteed by a UNIQUE constraint in Postgres rather than an in-memory check
- **SLA Refunds** (*prototype, in progress*) — Automated carrier SLA refund claims: 13 NestJS microservices over NATS with typed streams, a dead-letter queue persisting every failed event, AES-256-GCM encrypted credentials and multi-tenancy through RLS
- **WhatsApp CRM** (*prototype, in progress*) — Multi-tenant CRM on the WhatsApp Business API: shared agent inbox, lead pipeline and reminders. Tenant isolation enforced by 40 RLS policies rather than application-level WHERE clauses, with a webhook that answers Meta instantly and processes in background via BullMQ

Education

MEDAC

Higher Vocational Diploma — Web Application Development

Málaga, Spain

2022-2024

U-TAD (Universidad Camilo José Cela)

BA in Interactive Product Design

Madrid, Spain

2014-2018

Languages

Spanish: Native ▪ **English:** B2 (Cambridge First Certificate) ▪ **German:** Elementary
